

Access from Apple Mail

The instructions provided in this section were verified against Apple Mail 13.4 and newer. Please remember to utilize username@dreamscape.com or mail.dreamscape.com where appropriate.

You can set up your mail account in Apple Mail in two ways:

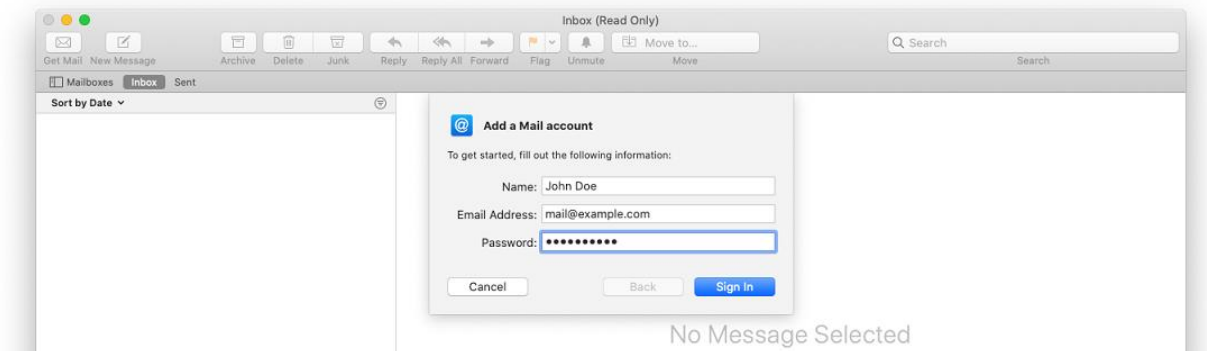

- Manually.
- Automatically. You will not have to specify most of the mail settings. Instead, Plesk will generate a link using which Apple Mail will download your mail profile with the necessary settings.

To set up Apple Mail manually:

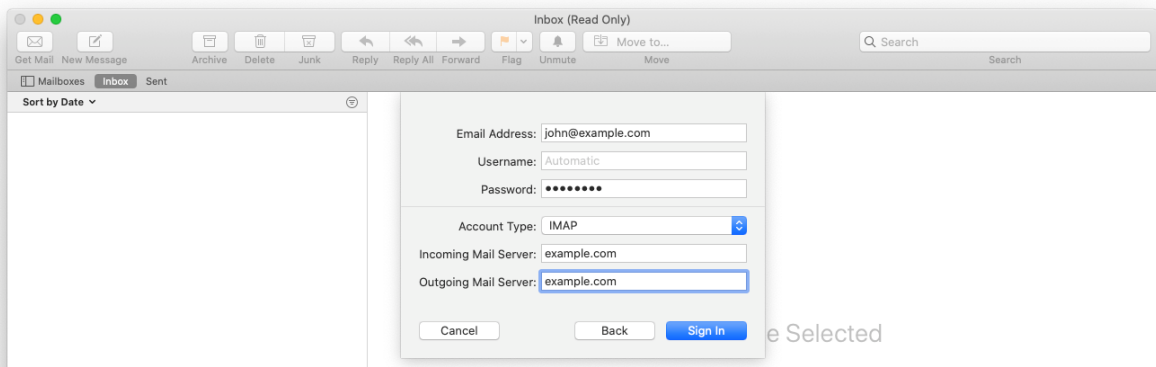

1. Open Apple Mail select the “Other Mail Account” option, and then click **Continue**.

2. Specify the following information and then click **Sign In**:
 - The name that will be displayed in your emails.
 - Your full email address, for example, mail@dreamscape.com.
 - The password of your email account.

3. Select your account type. To keep the copies of email messages on the server, select “IMAP”. If you do not want to keep them on the server, select POP.

4. Specify the domain names of the incoming and outgoing mail servers and then click **Sign In**.
5. Once the settings are verified, choose what apps you want to use with the mail account and then click **Done**.
